

Figure 1. Reliability-oriented radar proposal refinement overview

Baseline detector -> M1 candidate preservation -> M2 residual recovery -> M3 quality alignment -> M4 strict voting

Strict evaluation: 4 datasets x 3 seeds | 12 paired gains vs RDAR | Progressive ablation and formal comparison | Efficiency + calibration + qualitative evidence

Detection / proposal flow

Failure modes and evidence hooks

— baseline — module steps — strict selection

The figure separates proposal refinement from evidence hooks to avoid conflating strict and high-performance routes.
